ABQ56306 to ABQ60787 represent isolated nucleic acids (I) differentially expressed in cancer tissues. ABB78993 to ABB79004 represent proteins encoded by the ABQ60776 to ABQ60787 nucleic acid sequences. (I) can be used in antisense therapy. An antibody immunoreactive with a polypeptide encoded by (I) is useful for detecting cancer in a patient sample, and correcting the presence or absence of a polynucleotide encoded by a nucleic acid which hybridises to (I) in a coll. A probe/primer derived from (I) can be used for determining the presence of a nucleic acid which hybridises to (I) in a coll. A probe/primer derived from (I), and for determining the phenotype of cells in a sample of cells from a patient. (I) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate macroarrays on a solid surface, to identify a chromosome on which the corresponding gene resides, and in tissue profilling, forensics, genetic analysis, mapping and diagnostic applications. (I) can be used to raise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid molecules encoding human secreted proteins, used in preventing, treating or ameliorating a disorder, e.g. Alzheimer's and
                   The invention relates to the isolation of genes AAC66410-C66458 encod 49 human secreted proteins AAB32002-B32050. The genes can be used to generate fusion proteins by linking to the gene for the human immunoglobulin G Fc portion (SEQIDI) for increasing the stability of the fusion protein as compared to the human protein only. The genes a proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and overlan cancer and other cancers of the adrenal gland, bone, bon marrow, breast, gastrointestinal tract, liver, lung, or urogenital:

(b) immune disorders e.g. Addison's disease, allergies, autoimmune

            The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynuclectides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive,

The nucleic acids are useful for preventing the growth of cancer cells and/new blood vessels, and for treating patients suffering from a cancer, e.g. nasopharyngeal tumour, thyroid tumour, leukaemla, lymphoma, or cancer of the breast, lung, prostate, ovary or colon. PSGen 13 may also be used to suppress the transformed phenotype of a malignant cell. Administration of PSGen 13 gene or protein may result in a decrease in tumour mass, number of cancer cells, serum tumour marker, tumour metastasis, vascularisation, perfusion, or rate of tumour growth, improved clinical symptoms, and/or increased patient survival. The present sequence represents the coding sequence of human Progression Suppressed Gene 13 (HuPSGen 13).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     76 TGTTCCTCCTAGGGCGCGCGAAGCTGAGGGGTTCAGACCCACGCGGCGAGCACTC 135

                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                   rat or human progression Suppressed Gene 13 (PSGen 13) protein. The nucleic acids are useful for preventing the growth of cancer cells and/or new blood vessels, and for treating patients suffering from a cancer, cancer of the breast, lung, prostate, ovary or colon. PSGen 13 may also he used to suppress the transformed phenotype of a malignant cell. Administration of PSGen 13 gene or protein may result in a decrease in tumour mass, number of cancer cells, serum tumour marker, tumour metastasis, vascularisation, perfusion, or rate of tumour growth, improved clinical symptoms, and/or increased patient survival. The present sequence represents the coding sequence of rat Progression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         900

has suppressed expression in progressed tumour cells. PsGeni3 was identified using new methods for identifying nucleic acids differentially expressed between two samples. The method involves performing reciprocal subtraction differential RNA display (RSDD) between the two samples to generate two subtraction samples. The subtraction samples are amplified and compared to identify those nucleic acids that are differentially expressed. The method is used to identify and clone differentially expressed genes, particularly those with increased or reduced expression and progression elevated genes (PEGen). The method reduces the complexity of the band pattern produced in conventional differential RNA display of the bands may be obscured, resulting in false positive signals) since most bands common to both samples are eliminated, allowing identification and reamplified requires only a single anchored primer for amplification and reamplified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This sequence is the progression suppressed gene 13 (PSGen13). Kouwijzer M.L.C.E., Robillard G.T., Dijkstra B.W.;
The structure of the Escherichia coli phosphotransferase IIAmannitol
reveals a novel fold with two conformations of the active site.",
Structure 6:377-388(1998).
-1- FUNCTION: THIS IS A COMPONENT OF THE PHOSPHOENOLPYRUVATE-DEDENDENT
SUGAR PHOSPHOTRANSFERASE SYSTEM (PTS), A MAJOR CARBOHYDRATE ACTIVE
TRANSPORT SYSTEM. THE IICD DOMAINS CONTAIN THE SUGAR BINDING SITE
AND THE TRANSMEMBRANE CHANNEL, THE IIA DOMAIN CONTAINS HE PRIMARY
PHOSPHORYLATION SITE (THE DONOR IS PHOSPHO-HPR): IIA TRANSFERS ITS
PHOSPHORYL GROUP TO THE IIB DOMAIN WHICH FINALLY TRANSFERS IT TO
                                                                                                                                               21-JUL-1986 (Rel. 01, Last sequence update)
15-JUN-2002 (Rel. 41, Last annotation update)
PTS system, mannitol-specific ITABC component (EIIABC-MTL) (Mannitol-permease IIABC component) (Phosphotransferase enzyme II, ABC component) (EC 2.7.1.69) (EII-MTL).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEQUENCE FROM N.A.

Natl. Acad. Sci. U.S.A. 90:5524-5528(1993).
-1- FUNCTION: REQUIRED FOR MITOCHONDRIAL GENOME MAINTENANCE.
-1- SUBCELLULAR LOCATION: Mitochondrial.
-1- SIMILARITY: BELONGS TO THE DYNAMIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Transit peptide; Mitochondrion.

"Differential expression of a family of putative adenylate/guanylate cyclase genes in Trypanosoma brucei.";

Mol. Biochem. Parasitol. 43:29-288(1990).

-!- FUNCTION: COLLD ACT AS A RECEPTOR FOR A UNKNOWN LIGAND.

-!- CATALYTIC ACTIVITY: ATP = 3',5' cyclic AMP + diphosphate.

-!- SUBCELLULAR LOCATION: Membrane-bound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
